

VISIBLOAI

Launch Implementation & Developer Handover Document

Production Release – Trial, Subscription, Onboarding, Billing & First-Login Experience

Product	VisibloAI – AI Local Visibility & Business Automation Platform
Document purpose	Final implementation changes required before public launch
Release status	Core product completed; launch-blocking commercial/onboarding changes pending
Trial model	14 days; ₹99 activation fee; valid coupon may reduce activation fee to ₹0
Subscription terms	1 month, 3 months, 6 months, 12 months; 3 months highlighted as recommended minimum commitment

1. Release Objective

VisbloAI is ready for commercial launch. This document defines the final production changes required so a new customer can discover the product, register, activate a trial, connect the business, understand the value of automation, and convert to a paid subscription without manual assistance.

- Do not redesign stable completed modules unless required by this document.
- Treat trial, coupon, billing, onboarding and entitlement rules as backend-controlled configuration, not hard-coded UI logic.
- Web app and mobile app must read the same account, subscription, trial, connection and onboarding state from APIs.
- All customer-facing prices must be read from Package/Plan configuration maintained by Admin.

2. VisbloAI Product Definition

VisbloAI is an AI-driven local visibility automation platform intended to reduce the manual work required to maintain a business's local digital presence. The launch product should present the following capability groups clearly.

Capability	Customer value / launch behavior
Local Visibility Dashboard	Single view of business profile health, visibility activity, pending actions and AI automation status.
Google Business Profile Connection	Connect supported Google Business Profile/location and use it as a primary business data source.
AI Business Setup	Use business category, location, services, description, logo/images and preferences to initialize automation.
AI Content Plan	Generate and maintain a 30-day content schedule with customer preview/edit controls.
Google Business Profile Posting	Prepare/schedule supported business posts after required account connection and permissions.
Social Media Auto Post	Customer mobile experience for supported connected social channels; show connection/status clearly.
AI Post Preview & Editing	Preview generated content, image/media, CTA and scheduled time before publication where applicable.
Post Status Center	Separate Scheduled, Draft, Preview/Approval, Published/Live and Failed/Needs Attention states.
Reviews & QR	Provide review QR/share mechanism and review-related customer workflow.
AI Website	Generate/manage the customer's AI-powered business website where included by package.
AI Plan Settings	Allow customer to control automation preferences, business goals, tone, posting settings and supported approval mode.
Notifications	Trial expiry, connection issues, scheduled/published content, payment, subscription and action-required alerts.
Subscription & Billing	Trial, coupon, plan purchase, renewals, invoices, payment status and entitlement enforcement.

3. Commercial Model to Implement

Item	Required rule
Trial duration	14 calendar days from successful trial activation.
Initial trial activation fee	₹99.
Coupon exception	If a valid coupon makes the trial activation fee ₹0, payment gateway collection is skipped and trial activates immediately.
Coupon validation	Server-side only. Validate code, status, validity dates, redemption limits, customer eligibility, applicable plan/trial and discount.
Paid durations	1 month, 3 months, 6 months and 12 months.
Recommended purchase	3-month plan should be visually marked 'Recommended' / 'Best to Get Results'. Do not block the 1-month option unless business later decides to remove it.
Plan pricing	Do not hard-code prices in app. Admin-configurable plan + duration price matrix.

GST / taxes	Calculate/display according to configured tax rules and invoice requirements.
Renewal	Show renewal date and renewal amount before confirmation. Auto-renew only if explicitly enabled and supported by the payment mandate.
Entitlements	Features and usage limits must be resolved from subscription/package entitlements.

4. Required Account & Subscription States

State	Meaning	App behavior
REGISTERED	Account created; onboarding not completed.	Resume onboarding.
TRIAL_PAYMENT_PENDING	₹99 is due and no zero-fee coupon applies.	Open trial activation/payment screen.
TRIAL_ACTIVE	14-day trial is active.	Allow trial entitlements; show days remaining.
TRIAL_EXPIRED	Trial ended without paid subscription.	Restrict premium actions; preserve data; show plan selection.
SUBSCRIPTION_ACTIVE	Paid entitlement is valid.	Normal product access.
PAYMENT_PENDING	Paid order initiated but not confirmed.	Show payment pending; verify asynchronously.
PAYMENT_FAILED	Gateway failure/decline.	Allow retry/change method.
PAST_DUE	Renewal/payment issue after active subscription.	Grace/restriction policy from Admin configuration.
SUBSCRIPTION_EXPIRED	Paid term ended.	Preserve data; restrict premium actions; show Renew.
SUSPENDED	Admin/risk/compliance suspension.	Block protected actions and show support instruction.

5. First Signup / First Login Experience

The first session is critical. Do not send a newly registered customer directly to the normal dashboard. Use a guided setup wizard with progress persistence so the customer can exit and resume.

Step / Screen	Purpose	Primary UI / action
1. Welcome to VisibloAI	Immediately explain what the platform will automate.	Benefits list + progress indicator + Continue.
2. Business Setup	Capture minimum business identity needed for AI configuration.	Business name, category, phone, website (optional), address/service area, city, logo; Continue.
3. Connect Google Business Profile	Connect the primary local business profile.	Connect Google button; account/location selector; connection status; supported Skip for Later.
4. Automation Consent & Terms	Obtain explicit customer authorization for automated actions.	Plain-language permissions summary; Terms/Privacy links; required consent checkbox; Confirm.
5. Choose Trial / Enter Coupon	Explain 14-day trial and activation fee.	₹99 activation, coupon field, Apply button, updated payable amount, Continue.
6. Payment or Zero-Fee Activation	Collect ₹99 only when payable amount > ₹0.	Gateway checkout OR 'Activate Free Trial' when coupon reduces payable amount to zero.
7. AI Setup Questions	Personalize automation.	Goals, services/products, target area, content tone, preferred CTA, business hours; Save.
8. AI Is Preparing Your Account	Prevent blank dashboard and communicate setup jobs.	Progress states: profile sync, plan generation, website/content setup as applicable.

9. Setup Complete	Confirm value and next action.	Summary cards + Go to Dashboard.
10. First Dashboard	Show readiness, trial countdown and high-value next actions.	14-day trial banner, setup checklist, AI status, 30-day plan preview, connection health, upgrade CTA.

6. Welcome Screen – Exact Content Requirements

The first screen after account creation should be a value-confirmation screen, not a pricing wall. Keep language simple and outcome-oriented.

- Improve your local business visibility with AI automation.
- Create and manage your 30-day business content plan.
- Schedule supported Google Business Profile and social content from one place.
- Preview or edit AI-generated posts when required.
- Track Draft, Scheduled, Published and Failed posts.
- Generate a review QR and simplify review collection.
- Use your AI website features when included in your package.
- Receive alerts when VisbloAI needs a connection, approval or payment action.

Primary CTA: “Set Up My Business”. Secondary action: “I’ll do this later” only where skipping does not prevent core setup.

7. Trial & Coupon Functional Flow

1. Customer registers and verifies required identity/contact fields.
2. Backend creates account in REGISTERED state; do not start the 14-day clock merely on form submission.
3. Customer reaches trial activation screen.
4. Backend returns trial configuration: duration=14 days, base_activation_fee=₹99, currency=INR.
5. Customer optionally enters coupon. Frontend sends coupon to validation API.
6. Backend returns discount, final payable amount and a signed/authoritative eligibility result.
7. If payable amount > ₹0: create payment order, collect payment, verify gateway signature/webhook, then activate trial.
8. If payable amount = ₹0: create a zero-value activation transaction/redemption record and activate trial without payment gateway.
9. Set trial_started_at and trial_ends_at server-side. Entitlements begin only after successful activation.
10. Coupon redemption must be atomic to prevent reuse/race conditions.

8. Subscription Purchase Flow

Duration	UI treatment	Backend requirement
1 Month	Available standard option.	Store duration_months=1; calculate start/end server-side.
3 Months	Highlight as Recommended / minimum recommended commitment.	duration_months=3.
6 Months	Show longer-term value/discount if configured.	duration_months=6.
12 Months	Annual option; show annual saving only if configured.	duration_months=12.

Important interpretation: the current requirement contains both a 1-month package and the statement that a minimum of 3 months needs to be paid. To keep the implementation internally consistent, this document treats 1 month as an available purchase option and 3 months as the recommended minimum commitment. If the commercial rule is instead 'customers may not purchase 1 month', Admin must be able to disable the 1-month duration without a code release.

9. Dashboard After First Signup

Area	Required behavior
Trial banner	Example: '12 days left in your 14-day trial'. Include Upgrade / Choose Plan.
Setup score/checklist	Google Business Profile, business details, logo/photos, services, automation consent, social connection, review QR.
AI Automation status	Active / Needs Setup / Paused / Action Required.
30-Day Content Plan	Show upcoming content and nearest scheduled item; allow Preview/Edit.
Visibility / activity snapshot	Show available business activity/visibility metrics without fake placeholder performance.
Connection health	Google and supported social integrations with reconnect/error states.
Recent activity	AI generated, scheduled, posted, edited, failed, review/QR events.
Quick actions	Preview next post, Edit business, Connect account, View calendar, Review QR, Upgrade.

10. Trial Expiry & Conversion UX

- Show countdown in dashboard from Day 1; do not wait until the final day.
- Send in-app/push/email reminders according to notification configuration (recommended checkpoints: 7 days left, 3 days, 1 day, expiry).
- Before expiry, show the customer's configured automation and saved work so the value is visible.
- At expiry, preserve customer data and generated history. Disable protected automation actions instead of deleting data.
- Expired account landing state should show plan options (1/3/6/12 months), package comparison, coupon input if applicable and payment CTA.
- On successful payment, subscription entitlements must activate immediately after verified payment confirmation/webhook.

11. Backend Data Model – Minimum Changes

Entity	Key fields / notes
plans	id, name, status, feature/usage entitlement definition.
plan_prices	plan_id, duration_months, base_price, sale_price, currency, tax behavior, active.
subscriptions	customer_id, plan_id, status, starts_at, ends_at, renewal settings, source.
trials	customer_id, status, started_at, ends_at, activation_fee, discount, paid_amount, coupon_redemption_id.
coupons	code, type, value, validity, usage limits, per-customer limit, eligible plans/durations, trial applicability, active.
coupon_redemptions	coupon_id, customer_id, order/trial reference, discount amount, redeemed_at; enforce uniqueness/limits.
orders	customer_id, order_type, plan/duration, subtotal, discount, tax, total, status.
payments	order_id, provider, provider_order_id, provider_payment_id, amount, currency, status, verified_at.
customer_onboarding	customer_id, current_step, completed_steps, completed_at, skipped steps, version.
consents	customer_id, consent_type, version, accepted_at, IP/device metadata where legally appropriate.
connections	customer_id, provider, external account/location IDs, status, token metadata/encrypted secret reference, last_sync_at.

entitlements	Resolved plan/trial feature access and usage limits; can be computed/cached but must remain server-authoritative.
--------------	---

12. API Requirements

Method / Endpoint	Purpose
POST /auth/register	Create account.
GET /me/launch-state	Return onboarding, trial/subscription, connection and entitlement state used to route first screen.
GET /billing/trial-config	Return current trial duration and activation fee.
POST /billing/coupons/validate	Validate coupon server-side and return pricing result.
POST /billing/trial/activate	Activate zero-fee trial or initialize paid activation flow.
GET /billing/plans	Return packages, duration prices and entitlements.
POST /billing/orders	Create subscription order.
POST /billing/payments/order	Create provider payment order where required.
POST /billing/payments/verify	Verify supported client-return payment data.
POST /webhooks/payment-provider	Authoritative asynchronous payment status processing; idempotent.
GET /onboarding	Get saved progress.
PUT /onboarding/step	Save step data and progress.
POST /consents	Record required consent/version.
POST /connections/google/start	Begin Google authorization.
GET /connections/google/callback	Complete supported authorization and persist selected account/location.
GET /dashboard/bootstrap	Return first dashboard data and action-required state.

13. Routing / Access Logic

On every authenticated app start, call the launch-state/bootstrap API before deciding the destination.

Condition	Route
Suspended	Suspension/support screen.
Required onboarding incomplete	Resume saved onboarding step.
Trial activation pending	Trial/coupon/payment screen.
Trial active	Dashboard with trial banner and trial entitlements.
Trial expired + no active subscription	Plan selection / upgrade screen.
Subscription active	Dashboard.
Payment pending	Payment status screen with server recheck.
Subscription expired	Renewal screen; retain accessible account/profile/history according to policy.

14. Payment Engineering Requirements

- Never activate paid access solely from a client-side success screen.
- Verify payment server-side and process provider webhook as the authoritative asynchronous confirmation.
- Webhook processing must be idempotent; repeated events must not create duplicate subscriptions/invoices.
- Store payment/order status transitions for audit.
- Zero-amount coupon activation must not create a fake successful gateway payment. Record it as a zero-value trial activation/redemption transaction.
- Use integer minor units (paise) for calculations where supported; avoid floating-point money arithmetic.
- Generate invoice/receipt records based on the configured tax/invoicing process.

15. Admin Panel Changes Required Before Launch

Admin area	Required controls
Packages	Enable/disable package, feature entitlements and limits.
Duration Pricing	Configure 1/3/6/12-month pricing and active durations.
Trial Settings	Trial enabled, days=14, activation fee=₹99.
Coupons	Create/edit/disable; fixed/percentage/100% trial fee waiver; validity and usage rules.
Customers	See onboarding, trial, subscription, payment, connections and account status.
Subscriptions	Activate/cancel/expire/extend where authorized; maintain audit trail.
Payments	Successful, pending, failed, refunds where supported.
Invoices	View/download invoice records.
AI Usage	Monitor usage by customer/package.
Connections	Connection health and last sync; never expose raw tokens.
Notifications	Templates/triggers for onboarding, trial and billing lifecycle.
Audit Logs	Commercial/admin/account state changes.

16. Mobile App / Web UI Rules

- Use one responsive onboarding specification across web and mobile, but optimize layouts per device.
- Do not show features the customer's current entitlement cannot use without a clear locked/upgrade state.
- Always distinguish 'connected', 'not connected', 'syncing', 'expired permission' and 'error'.
- Use skeleton/loading and empty states; never show fabricated analytics.
- All async AI operations need queued/processing/success/failure states and retry/action guidance.
- Persist drafts and onboarding progress after each step.
- Customer can reach Billing, Subscription, Support, Terms and Privacy from account/settings.

17. Analytics / Product Events

Instrument the funnel so launch decisions are based on measurable conversion.

Event	Example properties
signup_completed	source, device, business_category
onboarding_step_completed	step, elapsed_time
gcp_connection_completed	locations_count
trial_coupon_applied	coupon_id/code reference, discount result
trial_activated	paid_amount, coupon_used
trial_activation_payment_failed	provider/error category
content_plan_generated	generation status
first_post_previewed	day_from_trial_start
first_post_published	channel, day_from_trial_start
plan_viewed	plan_id, duration
checkout_started	plan_id, duration, amount
subscription_activated	plan_id, duration, amount
trial_expired	setup_completion, key features used

18. Security & Reliability Checklist

- Encrypt OAuth/provider secrets at rest and restrict access by tenant/customer.
- Enforce tenant isolation on every customer resource query.
- Rate-limit authentication, coupon validation, AI generation and public endpoints.

- Validate webhook signatures and protect against replay/idempotency issues.
- Use role/permission checks for Admin operations.
- Log security-sensitive state changes without logging tokens/passwords.
- Provide connection token refresh/re-authentication handling.
- Back up production database and verify restore procedure before launch.
- Configure monitoring for failed queues, failed webhooks, payment errors, connection sync failures and AI jobs.

19. QA / Acceptance Criteria

Test scenario	Expected result
New user – ₹99 trial	Register → onboarding → no coupon → ₹99 payment verified → exactly 14-day trial active.
New user – 100% coupon	Valid coupon → payable ₹0 → gateway skipped → 14-day trial active → redemption recorded.
Invalid/expired coupon	Clear error; original ₹99 remains; no redemption.
Coupon reuse beyond limit	Rejected server-side.
Payment failure	Trial not activated; retry available.
Payment webhook retry	No duplicate activation/order/subscription.
Onboarding interruption	Close app at any step → reopen → resume same valid step.
Trial expiry	Premium automation restricted at correct server time; customer data retained; upgrade shown.
Subscription purchase	Each 1/3/6/12-month option calculates correct configured amount and end date.
Entitlement test	Package feature restrictions identical on web/mobile/backend.
Google connection failure	Actionable reconnect state; onboarding can resume.
First dashboard	Shows real account state, trial countdown, setup checklist and next action; no fake data.

20. Launch Blockers – Must Be Completed

- 14-day trial configuration and server-side trial clock.
- ₹99 trial activation payment flow.
- Coupon system including full ₹99 waiver / ₹0 checkout path.
- 1/3/6/12-month subscription duration matrix.
- First-signup onboarding wizard and resume behavior.
- Automation consent/terms acceptance recording.
- First dashboard trial banner + setup checklist.
- Trial expiry and upgrade/renewal restrictions.
- Payment verification + idempotent webhook processing.
- Admin controls for packages, prices, trial and coupons.
- Production analytics events and error monitoring.
- End-to-end QA on Android, iOS/web surfaces actually included in release.

21. Recommended First-Login Flow Summary

SIGN UP → WELCOME → BUSINESS SETUP → CONNECT GOOGLE → CONSENT → 14-DAY TRIAL / COUPON → ₹99 PAYMENT OR ₹0 ACTIVATION → AI SETUP → PREPARATION → DASHBOARD

22. Developer Definition of Done

The release is considered ready only when a brand-new customer can complete the full journey without developer/admin intervention and the same state is correctly reflected across customer app, web/admin and billing records.

- All acceptance criteria pass in staging and production smoke test.
- No price/trial/coupon business rule is hard-coded in multiple clients.
- All payment and subscription state transitions are auditable.
- First-time customer receives a guided setup and never lands on an unexplained empty dashboard.
- Expired trial/payment failures cannot access protected automation by manipulating frontend state.
- Existing customers are migrated safely and do not get forced through inappropriate first-time onboarding.
